It is widely understood that good, affordable eco-housing needs to be at the heart of any attempt to mitigate or adapt to climate change. This is the first book to comprehensively explore eco-housing from a geographical, social and political perspective. It starts from the premise that we already know how to build good eco-houses and we already have the technology to retrofit existing housing. Despite this, relatively few eco-houses are being built. Featuring over thirty case studies of eco-housing in Britain, Spain, Thailand, Argentina and the United States, Eco-Homes examines the ways in which radical changes to our houses – such as making them more temporary, using natural materials, or relying on manual heating and ventilation systems – require changes in how we live. As such, it argues, it is not lack of technology or political will that is holding us back from responding to climate change, but deep-rooted cultural and social understandings of our way of life and what we expect our houses to do for us. Popular Science gives our readers the information and tools to improve their technology and their world. The core belief that Popular Science and our readers share: The future is going to be better, and science and technology are the driving forces that will help make it better. We are in a power crunch and you need help. It is not going to go away. Fuel costs, population increases, or the need to reduce air pollution will all keep us in a power hungry situation. Either we cannot afford it, can no longer breathe it, or there will not be enough. The purpose of this book is to ease the problem. Better start learning now.Experience is the best teacher, but you need help before you can acquire experience on your own.Next best is to benefit from another's experience. This book collects the relevant material from most of the authors' over 50 books. They were written for people who want to help themselves. Does that include you?This book contains over 50 years of ways we have used to conserve energy. We started early: The message of energy shortages to come wasn't widely publicized, although it's coming was announced and published in the 1950's.We hope that rolling blackouts are the most with which we will have to cope. In today's culture, even that is a minor disaster. Electricity is the hinge upon which our lives swing. Most of us can't even tell time without electricity, or when it comes back on, how do we reset the clocks? In fact, every floating automatic device in the house will need resetting.We depend upon electricity for all the niceties of living. What about the necessities?Food Preservation and SpoilageHeatLight- both to see and for securityWater-. No hot water without electricity. City and Rural water is supplied by electric pumps.Enjoy air conditioning? A hot tub, Hot water? These are things we can live without if we must, although there are energy efficient ways to have these things. Otherwise, either the cost of having them or the need to use a minimum of electricity may make them unavailable. Solar Energy will heat your home and provide hot water. It will even heat a hot tub.We use what is in this book ALL the time. This publication is intended to help plan a successful installation of a wood-burning heating system and to use the system in the most safe and effective way. Topics covered include: low-emission wood burning technology; wood heating options, including space heaters, wood stoves, conventional and high-efficiency fireplaces, pellet stoves, high thermal mass masonry heaters, and central heating; planning a space heater installation; installation safety; installation of wood stoves and flue pipes; chimneys; avoiding wood smoke spillage; efficient wood combustion; purchasing and preparing the wood supply; calculating costs of heating; and heating system maintenance. Passive solar heating and passive cooling—approaches known as natural conditioning—provide comfort throughout the year by reducing, or eliminating, the need for fossil fuel. Yet while heat from sunlight and ventilation from breezes is free for the taking, few modern architects or builders really understand the principles involved. Now Dan Chiras, author of the popular book The Natural House, brings those principles up to date for a new generation of solar enthusiasts. The techniques required to heat and cool a building passively have been used for thousands of years. Early societies such as the Native American Anasazis and the ancient Greeks perfected designs that effectively exploited these natural processes. The Greeks considered anyone who didn't use passive solar to heat a home to be a barbarian! In the United States, passive solar architecture experienced a major resurgence of interest in the 1970s in response to crippling oil embargoes. With grand enthusiasm but with scant knowledge (and sometimes little common sense), architects and builders created a wide variety of solar homes. Some worked pretty well, but looked more like laboratories than houses. Others performed poorly, overheating in the summer because of excessive or misplaced windows and skylights, and growing chilly in the colder months because of insufficient thermal mass and insulation and poor siting. In The Solar House, Dan Chiras sets the record straight on the vast potential for passive heating and cooling. Acknowledging the good intentions of misguided solar designers in the past, he highlights certain egregious—and entirely avoidable—errors. More importantly, Chiras explains in methodical detail how today's home builders can succeed with solar designs. Now that energy efficiency measures including higher levels of insulation and multi-layered glazing have become standard, it is easier than ever before to create a comfortable and affordable passive solar house that will provide year-round comfort in any climate. Moreover, since modern building materials and airtight construction methods sometimes result in air-quality and even toxicity problems, Chiras explains state-of-the-art ventilation and filtering techniques that complement the ancient solar strategies of thermal mass and daylighting. Chiras also explains the new diagnostic aids available in printed worksheet or software formats, allowing readers to generate their own design schemes.
